

MCP · Local-First Server

NextFlows: Secure TypeScript MCP Server

Connecting Local Workspaces & AI for Seamless Context

The Problem

AI Isolation

AI models are incredibly powerful, but they're disconnected from your local workspace files and your team's private notes.

Wasted Time

Developers spend significant time constantly switching between code, project docs, and AI conversations to find answers or design patterns.

The Solution

NextFlows — a secure MCP server that connects your local notes directly to Claude Desktop, in a single request.

Architecture Overview

Connection Method: Built on the Model Context Protocol (MCP), communicating over standard input/output (stdio).

Data Flow

Security First

Fully local-first execution keeps your project's data and files private, with no need to upload anything to an external cloud.

Tools Table

Tool	Primary Function
<code>search_notes</code>	Quickly searches local notes and retrieves context related to a keyword.
<code>list_documents</code>	Lists the documents and files available in the workspace.
<code>read_document</code>	Reads the content of a specific file or document and displays it directly inside the AI interface.

Next Steps & Q&A

Search Enhancement

Integrate vector-based semantic search alongside traditional keyword search.

Automatic Sync

Link documentation directly to code repository updates (Git commits).
